APPENDIX 7. INVESTIGATIONS – SOIL SAMPLING

17 June 2019

Mr George Kiritsis
Harcourts Williams Luxury
60 Kensington Road
Rose Park SA 5067

Dear George

Re: Medindie Soil Sampling

1. Introduction

Environmental Projects (EP) was commissioned by Harcourts Williams Luxury (HWL) to undertake in-situ soil sampling at 43 Main North Road, Medindie, South Australia (the site). A site location plan is provided as Figure 1, **Attachment 1**.

EP understood:

- the site has an area of approximately 1500 m^2 and is occupied by a large shed structure on the Main North Road frontage. Approximately 500 m^2 at the rear of the site is unsealed
- the site was formerly used for vehicle maintenance and there's a possibility that waste oils and other liquids may have been disposed of on the unsealed portion of the site
- it was unknown if there were any underground storage tanks (USTs) on site
- soil sampling was required as part of initial investigations for offsite waste soil disposal classification and for potential site redevelopment for high density-residential use.

1.1 Objectives

The objective of the soil sampling was to determine the waste disposal classification of in-situ soils.

1.2 Regulatory Guidance

Intrusive assessment of soils at the subject site was completed with reference to the guidance in the following publications:

- Environment Protection Authority SA (2010) Standard for the production and use of Waste Derived Fill, South Australia
- Environment Protection Authority SA (2018) Guidelines for the assessment and remediation of site contamination

- Environment Protection Authority Victoria, 2007. Soils Sampling Guideline (Off-site Management and Acceptance to Landfill). Publication 1178
- National Environmental Protection (Assessment of Site Contamination) Measure (ASC NEPM) 1999 (as amended 2013)
- Standards Australia (AS) 4482.1-2005: Guide to the investigation and sampling of sites with potentially contaminated soil Part 1: Non-volatile and semi-volatile compounds
- Standards Australia, AS 4482.2-1999 Guide to the investigation of potentially contaminated soil Part 2: Volatile substances

2. Methodology

The scope of works and the soil sampling methodology completed is outlined in Table 2-1.

Table 2-1: Soil sampling methodology

Activity	Description
Preparation of Environment, Health and Safety (EHS) Plan	Prior to the commencement of fieldwork, EP prepared and EHS plan to identify known hazards to the health and safety of project personnel and the environment, based on an understanding of the work and EP's experience on similar projects.
Soil sampling	On 28 March 2019, 8 soil bores (SB1-SB8) were drilled using push tube methodology by licensed driller Aussie Probe. Sample locations are provided on Figure 2, **Attachment 1**. Soil samples were collected at depths considered appropriate for sampling by EP to ensure all discrete soil layers were sampled. 35 primary samples were collected.
Sample handling	Samples were handled exclusively by EP personnel and were stored in glass jars provided by the primary contract laboratory, Envirolab. Disposable nitrile gloves were worn whilst handling all samples and were replaced prior to the collection of each sample.
Soil gas screening	A calibrated photo-ionisation detector (PID) was used to screen replicate soil samples for the presence of volatile organic compounds (VOCs). Soil samples were placed into zip-lock plastic bags and allowed to equilibrate under ambient temperatures before PID readings were undertaken. PID readings were recorded on the soil logs and are provided in **Attachment 2**.
Decontamination of sampling equipment	Core trays and push tubes were decontaminated using a phosphate free Decon 90 solution followed by a potable water rinse.
Quality control blanks and duplicate samples	Eight blind coded duplicates were collected whilst sampling. One duplicate (Dup 7, duplicate of SB7-1) was selected for intra-laboratory testing at Envirolab and one duplicate (Dup 6, duplicate of SB6-2) was selected for inter-laboratory testing at secondary laboratory Australia Laboratory Services (ALS). One equipment rinsate sample (EB) was collected and one trip blank sample (TB) was placed in the sample batch accompanying the soil jars from the field to the laboratory. EP's QA/QC methodology was generally consistent with the recommendations in ASC NEPM.
Soil logging	Soils encountered at each location were logged in general accordance with Standards Australia (1993) Geotechnical Site Investigations AS1726. Soil logs are provided as **Attachment 2**.
Sample preservation and transportation	All samples were stored under chilled conditions in a portable cooler immediately after sampling and prior to and during delivery to the laboratory. Sample transport was performed in accordance with EP's COC procedures.
Laboratory analysis	The following laboratory testing was requested:

Activity	Description
	Eight primary samples (and one intra-laboratory duplicate and one inter-laboratory duplicate) were selected for: - heavy metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel and zinc) - total recoverable hydrocarbons (TRH) - benzene, toluene, ethylbenzene, xylene and naphthalene (BTEXN) Four primary samples were selected for: - polycyclic aromatic hydrocarbon (PAH) - volatile organic compounds (VOC) One primary sample was selected for a [1]NEPM HIL Screen. Envirolab and ALS were both NATA accredited for the selected testing.
Additional laboratory testing (ASLP and MEP)	On review of the primary laboratory results Toxicity Characteristic Leaching Procedure (TCLP) was completed using Australian Standard Leaching Procedure (ASLP) on metals (arsenic, copper, lead and zinc). Multiple Extraction Procedure (MEP) was selected for sample SB8-2 for benzo(a)pyrene.

[1]NEPM HIL screen – metals (arsenic, beryllium, boron, cadmium, chromium, cobalt, copper, lead, manganese, mercury, nickel, selenium, zinc), hexavalent chromium, cyanide, PAHs, phenol, pentachlorophenol, cresols, DDT+DDE+DDD, aldrin+dieldrin, chlordane, endosulfan, endrin, heptachlor, hexachlorobenzene (HCB), methoxychlor, chlorpyrifos, polychlorinated biphenyl (PCB), mirex, toxaphene, atrazine, bifenthrin

3. Screening Criteria

Soil Disposal

Concentrations are assessed against applicable soil disposal criteria to determine waste classification. The criteria used to assess the suitability of soils for re-use and /or for off-site disposal are documented in the following guidelines:

- Environment Protection Authority (2010) Standard for the production and use of Waste Derived Fill, South Australia:
  - Waste Fill Criteria (WF)
  - Intermediate Waste Soil Criteria (IWS)
  - Low Level Contaminated Waste Criteria (LLCW).

Maximum permissible chemical concentrations for these waste classifications are referred to collectively as the soil disposal criteria and are presented in soil chemical summary tables.

In addition to chemical content, consideration was given to the physical requirements of WF as defined in the Environment Protection Regulations 2009. “Waste Fill” is defined as waste containing clay, concrete, rock, sand, soil or other inert mineralogical matter in pieces not exceeding 100 mm in length (but does not include waste consisting of asbestos or bitumen).

The SA EPA accepts use of the 95% Upper Confidence Limit (UCL) about the mean for establishing statistical contaminant concentration average for comparison to disposal criteria. However, for the 95% UCL to apply, the data set must be reviewed for potential hot spots of contamination via the following additional criteria:

- Maximum concentration less than 250% of the chemical criterion; and
- Standard deviation less than 50% of the chemical criterion.

Deviation from these cut off criteria may indicate the presence of anomalous or isolated hot spot concentrations, which may require segregation for appropriate risk management.

4. Results

The following section summarises the field observations and results of laboratory testing.

Detailed descriptions of the in-situ materials encountered, and depth intervals identified are summarised in the soil logs in **Attachment 2**. Tabulated laboratory analytical results are provided in **Attachment 3**.

4.1 Surface and Sub-surface Conditions

Fill material was encountered at all locations to a maximum depth of 0.6 mBGL at SB5 and generally consisted of a mix of fine to coarse grained grey brown gravelly/clayey sand, with low plasticity clay. Foreign inclusions in fill were noted as follows:

- Trace brick at SB3, SB5, SB7 (in two fill layers) and SB8
- Trace ash at SB5, SB7 (in two fill layers) and SB8
- Trace glass at SB7 (in two fill layers) and SB8.

Natural soils were encountered at all locations and generally consisted of low to medium plasticity, brown clay with trace fine to medium grained sand, grading to medium plasticity, brown/pale yellow silty sandy/silty gravelly clay, with fine to coarse grained sand and fine to medium gravel.

The highest PID reading noted was 0.1 ppmv, indicating concentrations of VOC's in soils on site were negligible.

A mechanic's service pit was noted inside the shed and soil bores SB3 and SB4 were drilled immediately adjacent to it.

4.2 Analytical Results

Chemical summary tables are presented in Attachment 3. Where a sample exceeded a relevant criterion, the concentration has been highlighted. Laboratory certificates and chain of custody documentation is provided in **Attachment 4**.

Various exceedances of the disposal criteria were noted across the site and are shown in Table 4-1.

Table 4-1: Samples exceeding soil disposal criteria

Analyte	Sample exceeding WF	Sample exceeding IWS	Sample exceeding LLCW
Benzo(a)pyrene	SB7-2	SB3-1, SB5-3	SB8-2
PAHs (sum of total)	SB3-1, SB5-3, SB7-2	SB8-2	-
TPH +C_{10}-C_{36} (sum of total)	-	SB7-2	-
TPH C_{10}-C_{40} (sum of total)	-	SB7-2	-
Arsenic	SB2-1, SB5-3, SB7-1, SB7-2	-	-
Copper	SB1-1, SB2-1, SB7-1, SB8-2	-	-

Analyte	Sample exceeding WF	Sample exceeding IWS	Sample exceeding LLCW
Lead	SB1-1, SB3-1, SB7-1, SB7-2, SB8-2	-	-
Zinc	SB1-1, SB3-1, SB7-1, SB7-2, SB8-2	-	-

Concentrations of chlorinated hydrocarbons, halogenated phenols, halogenated benzenes, halogenated hydrocarbons, herbicides, organochlorine pesticides, pesticides, polychlorinated biphenyls, solvents and MAH's were all below laboratory limits of reporting (LOR).

4.3 Leachate Results

ASLP analysis was requested for Sample SB1-1 for copper and zinc and for sample SB7-2 for arsenic and lead. All samples had concentrations above the laboratory LOR but below the maximum leachate concentration.

Sample SB8-2 had benzo(a)pyrene concentrations above Low Level Contaminated Waste criterion. The sample was submitted for MEP analysis and concentrations of benzo(a)pyrene and other PAH compounds in leachate were below the laboratory LOR for each extraction.

The results of the MEP analysis suggested the fill material complied with Low Level Contaminated Waste.

5. Data Validation

An evaluation of QA/QC information is provided in Table 5-1 below. This includes consideration of data quality objectives outlined in the ASC NEPM 1999 (as amended 2013) covering both field methodology and laboratory data integrity. As part of the evaluation, field duplicate sample chemical data were compared by determining the relative percentage difference (RPD) between the results. The RPD was calculated using the formula:

$$RPD\ (\%) = 100(x1 - x2) / X$$

Where x1, x2 are duplicate results and X is the mean of duplicate results

- Based on guidance provided in reference documents:
- Typically, acceptable RPD values for soil are considered to be +/-30%
- A soil RPD within the range of +/- 30% is considered to show acceptable agreement and conversely, data is considered to have poor agreement where an RPD is outside this range.

The acceptance criteria for internal laboratory replicates is set at an RPD of +/- 20%. Laboratory recoveries should be in the range of 70% to 130%. Duplicate RPDs and equipment rinsate and trip blank results are provided in **Attachment 3**. The results of internal laboratory quality control procedures are provided within the laboratory certificates in **Attachment 4**.

Table 5-1: Soil data validation

QA/QC Aspect	Compliant	Comment
COC documentation completed	Yes	All samples were transported under COC procedures.

QA/QC Aspect	Compliant	Comment
Samples delivered to the laboratory within sample holding times and in laboratory-supplied containers with the correct preservative	Mostly	All samples were delivered to the laboratories within the sample holding times and in laboratory-supplied containers, excluding MEP analysis of benzo(a)pyrene (PAHs). MEP analysis of sample SB8-2 for PAHs in soil was requested outside of the laboratory's recommended technical holding times. US EPA document "Sample Holding Time Re-evaluation" (October 2005) concluded that "*For the most part, the … representative PAHs exhibited stability for a length of time at least double that of the recommended MHT in all 3 soils/sediments and both storage conditions*" suggesting that the exceedance of technical holding time in this instance would not affect the results given the samples were within double the recommended MHT.
All analysis NATA accredited	Yes	Chemical analysis was undertaken in accordance with Shedule B(3) of the ASC NEPM. Envirolab and ALS performed all analysis and were NATA accredited for all analyses.
Equipment calibrations	Yes	The PID was calibrated by the rental company prior to the field event. PID calibration certificates are included in **Attachment 2**.
Required number of sample duplicates and blanks collected	Yes	Nine primary samples were selected for analysis. One duplicate sample was submitted for intra-laboratory analysis and one duplicate sample for inter-laboratory analysis, meeting recommendations in AS4482.1-2005 and ASC NEPM for nine primary samples. Equipment rinsate blank and trip blank samples were submitted for analysis.
Soil QA/QC samples reported RPDs within limits set by AS4482.1-2005 and ASC NEPM	Mostly	The majority of duplicate pair RPDs were within +/- 30% except for: • Lead (31%) for duplicate pair SB6-2/Dup 6 • TRH +C_{10}-C_{36} (sum of total) (69%) and TRH C_{10}-C_{40} (sum of total) (62%) for duplicate pair SB7-1/Dup 7. These RPD exceedances were likely due to the heterogeneous distribution of analytes in soil, and overall the analytical results indicated good data correlation between the primary and duplicate results.
Acceptable field blank sample results	Yes	Equipment rinsate blank and trip blank sample concentrations were below laboratory LOR, indicating field decontamination procedures and sample transportation procedures were effective at limiting the risk of cross-contamination between samples.
Acceptable laboratory QC results	Mostly	Envirolab reported duplicate exceedances for nickel and several TRH fractions and PAHs. Reanalysis of all duplicates indicated exceedances were likely due to sample heterogeneity. The remaining method blanks, laboratory control spikes and matrix spikes were within acceptable limits. ALS reported all internal and external laboratory duplicates, method blanks, laboratory control spikes and matrix spikes were within acceptable limits.

EP considered the results of the QA/QC processes and testing data summarised in Table 5-1 provided appropriate confidence that the data couple be relied upon, therefore the data quality was acceptable for the purposes of the assessment.

6. Conclusions

Laboratory MEP analysis for benzo(a)pyrene confirmed leachate concentrations in each extract were below the laboratory LOR and suggested the material complies with Low Level Contaminated Waste.

Laboratory ASLP analysis for metals (arsenic, copper, lead and zinc) confirmed concentrations of these metals in several samples complied with Intermediate Waste soils.

Based on the field observations and laboratory results of selected soil samples the fill material across site was classified as Low Level Contaminated waste and needs to be disposed of to a licensed landfill facility. Soil cartage needs to be completed by an appropriately licensed contractor.

The proposed receiving site should be provided with a copy of this report prior to transportation of soil to the site.

LIMITATIONS

Scope of Services

This environmental site assessment report (the report") has been prepared in accordance with the scope of services set out in the contract, or as otherwise agreed, between the client and Environmental Projects ("scope of services"). In some circumstances the scope of services may have been limited by a range of factors such as time, budget, access and/or site disturbance constraints.

Reliance on Data

In preparing the report, Environmental Projects has relied upon data, surveys, analyses, designs and plans as well as any other information provided by the client and other individuals and organisations, most of which are referred to in the report ("the data"). Except as otherwise stated in the report, Environmental Projects has not verified the accuracy or completeness of the data. To the extent that the statements, opinions, facts, information, conclusions and/or recommendations in the report ("conclusions") are based in whole or part on the data, those conclusions are contingent upon the accuracy and completeness of the data. Environmental Projects will not be liable in relation to incorrect conclusions should any data, information or condition be incorrect or have been concealed, withheld, misrepresented or otherwise not fully disclosed to Environmental Projects.

Environmental Conclusions

In accordance with the scope of services, Environmental Projects has relied upon the data and conducted environmental field monitoring and/or testing in the preparation of the report. The nature and extent of monitoring and/or testing conducted is described in the report.

On all sites, varying degrees of non-uniformity of the vertical and horizontal soil or groundwater conditions are encountered. Hence no monitoring, common testing or sampling techniques can eliminate the possibility that monitoring or testing results/samples are not totally representative of soil and/or groundwater conditions encountered. The conclusions are based upon the data and the environmental field monitoring and/or testing and are therefore merely indicative of the environmental condition of the site at the time of preparing the report, including the presence or otherwise of contaminants or emissions.

Also, it should be recognised that site conditions, including the extent and concentrations of contaminants, can change with time.

Within the limitations imposed by the scope of services, the monitoring testing, sampling and preparation of this report have been undertaken and performed in a professional manner, in accordance with generally accepted practices and using a degree of skill and care ordinarily exercised by reputable environmental consultants under similar circumstances. No other warranty, expressed or implied, is made.

Report for Benefit of Client

The report has been prepared for the benefit of the client and no other party. Environmental Projects assumes no responsibility and will not be liable to any other person or organisation for or in relation to any matter dealt with or conclusions expressed in the report, or for any loss or damage suffered by

any other person or organisation arising from matters dealt with or conclusions expressed in the report (including without limitations matters arising from any negligent act or omission of Environmental Projects or for any loss or damage suffered by any other party relying upon the matters dealt with or conclusions expressed in the report). Other parties should not rely upon the report or the accuracy or completeness of any conclusions and should make their own enquiries and obtain independent advice in relation to such matters

Other Limitations

Environmental Projects will not be liable to update or revise the report to take into account any events or emergent circumstances or facts occurring or becoming apparent after the date of the report.

Regards,

Brad Fitzgerald
Lead Consultant

CERTIFICATE OF ANALYSIS 16416

Client Details

Client	Environmental Projects
Attention	Brad Fitzgerald
Address	Level 3, 117 King William St, Adelaide, SA, 5000

Sample Details

Your Reference	**19032.01 Medindie Soil Sampling**
Number of Samples	2 Water, 42 Soil
Date samples received	29/03/2019
Date completed instructions received	29/03/2019

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Report Details

Date results requested by	05/04/2019
Date of Issue	05/04/2019

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Chris De Luca, Operations Manager

Authorised By

Pamela Adams, Laboratory Manager

Method ID	Methodology Summary
Inorg-008	Moisture content determined by heating at 105 deg C for a minimum of 12 hours.
Inorg-013	Cyanide - total determined colourimetrically after distillation, based on APHA latest edition, 4500-CN_C,E. Free cyanide determined colourimetrically after filtration and confirmed by diffusion. Solids are extracted in a caustic media prior to distillation and analysis.
Inorg-024	Hexavalent Chromium (Cr6+) - determined colourimetrically by discrete analyser.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis. Note, the Total +ve TRH PQL is reflective of the lowest individual PQL and is therefore "Total +ve TRH" is simply a sum of the positive individual TRH fractions (>C10-C40).
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS.
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Note, For OCs the Total +ve reported DDD+DDE+DDT PQL is reflective of the lowest individual PQL and is therefore simply a sum of the positive individually report DDD+DDE+DDT.
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Note, the Total +ve Cresols or Phenols PQL is reflective of the lowest individual PQL and is therefore" Total +ve Cresols or Phenols" is simply a sum of the positive individual Cresols or Phenols.

Method ID	Methodology Summary
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013. For soil results:- 1. 'EQ PQL'values are assuming all contributing PAHs reported as <PQL are actually at the PQL. This is the most conservative approach and can give false positive TEQs given that PAHs that contribute to the TEQ calculation may not be present. 2. 'EQ zero'values are assuming all contributing PAHs reported as <PQL are zero. This is the least conservative approach and is more susceptible to false negative TEQs when PAHs that contribute to the TEQ calculation are present but below PQL. 3. 'EQ half PQL'values are assuming all contributing PAHs reported as <PQL are half the stipulated PQL. Hence a mid-point between the most and least conservative approaches above. Note, the Total +ve PAHs PQL is reflective of the lowest individual PQL and is therefore" Total +ve PAHs" is simply a sum of the positive individual PAHs.
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS.
Org-012	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD or GC-MS. Note, the Total +ve PCBs PQL is reflective of the lowest individual PQL and is therefore" Total +ve PCBs" is simply a sum of the positive individual PCBs.
Org-013	Water samples are analysed directly by purge and trap GC-MS.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater. Note, the Total +ve Xylene PQL is reflective of the lowest individual PQL and is therefore "Total +ve Xylenes" is simply a sum of the positive individual Xylenes.
ORG-031	Acid herbicides and speciated phenols in soil by DCM:Acetone extraction with derivatisation and determination by GC-MS. Haloacetic acids in waters are derivatised and analysed by GC-ECD. Acid herbicides, speciated phenols, carbamates and ureas in water by DCM extraction with derivatisation and determination by GC-MS. Analysed by MPL, NATA accrediation 2901.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Report Comments

METALS: Laboratory %RPD acceptance criteria exceeded for laboratory sample number 16416-12 for Nickel, reanalysis indicates possible sample heterogeneity. Therefore triplicate issued as laboratory sample number 16416-45.

SVOC & TRH: Laboratory %RPD acceptance criteria exceeded for laboratory sample number 16416-34 for PAHs and TRH, reanalysis indicates possible sample heterogeneity. Therefore triplicate issued as laboratory sample number 16416-46.

PQL has been raised due to the high concentration of analytes in the sample/s, resulting in the sample/s requiring dilution.

QC Comments

METALS: Laboratory %RPD acceptance criteria exceeded for laboratory sample number 16416-12 for Nickel, reanalysis indicates possible sample heterogeneity. Therefore triplicate issued as laboratory sample number 16416-45.

SVOC & TRH: Laboratory %RPD acceptance criteria exceeded for laboratory sample number 16416-34 for PAHs and TRH, reanalysis indicates possible sample heterogeneity. Therefore triplicate issued as laboratory sample number 16416-46.

PQL has been raised due to the high concentration of analytes in the sample/s, resulting in the sample/s requiring dilution.

See Report 16416-[R00] for QA/QC details

HOLDING TIME COMPLIANCE EVALUATION

All preservation / holding times (based on AS/ASPHA/ISO/NEPM/USEPA reference documents and standards) are compliant.

Certain analyses have had their recommended technical holding times elongated by filtering and/or freezing on receipt at the laboratory (e.g. BOD, chlorophyll/Pheophytin, nutrients and acid sulphate soil tests).

Envirolab Services Pty Ltd
ABN 37 112 535 645 - 002

ph 03 9763 2500 fax 03 9763 2633
melbourne@envirolab.com.au
www.envirolab.com.au

COMPLIANCE TO QC FREQUENCY (NEPM)

Internal laboratory QC rate complies with NEPM requirements (LCS/MB/MS 1 in 20, Duplicates 1 in 10 samples). Note, samples are batched together with other sample consignments in order to assign QC sample frequency.

QC Evaluation	
Duplicate(s) was performed as per NEPM frequency	✓
Laboratory Control Sample(s) were analysed with the samples received	✓
A Method Blank was performed with the samples received	✓
Matrix spike(s) was performed as per NEPM frequency	✓

Refer to Certificate of Analysis for all Quality Control data.

Zinc in ASLP	mg/L	0.5	[NA]

Method ID	Methodology Summary
EXTRACT.7	Toxicity Characteristic Leaching Procedure (TCLP).
Inorg-001	pH - Measured using pH meter and electrode in accordance with APHA latest edition, 4500-H+. Please note that the results for water analyses are indicative only as analysis outside of the APHA storage times.
Inorg-004	Toxicity Characteristic Leaching Procedure (TCLP) using AS 4439 and USEPA 1311. Please note that the sample mass used may be scaled down from the default based on the sample mass available. Samples are stored at 2-6oC before and after leachate preparation.
Metals-020 ASLP	Determination of various metals by ICP-MS following leaching using neutralised deionised water by AS 4439.3 - 1997.

RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

DATA QUALITY ASSESSMENT SUMMARY

Report Details

Envirolab Report Reference	**16416-B**
Client ID	Environmental Projects
Project Reference	19032.01 Medindie Soil Sampling
Date Issued	27/05/2019

QC DATA

All laboratory QC data was within the Envirolab Group's specifications.

HOLDING TIME COMPLIANCE EVALUATION

All preservation / holding times (based on AS/ASPHA/ISO/NEPM/USEPA reference documents and standards) are compliant.

Certain analyses have had their recommended technical holding times elongated by filtering and/or freezing on receipt at the laboratory (e.g. BOD, chlorophyll/Pheophytin, nutrients and acid sulphate soil tests).

COMPLIANCE TO QC FREQUENCY (NEPM)

Internal laboratory QC rate complies with NEPM requirements (LCS/MB/MS 1 in 20, Duplicates 1 in 10 samples). Note, samples are batched together with other sample consignments in order to assign QC sample frequency.

QC Evaluation

Duplicate(s) was performed as per NEPM frequency	✓
Laboratory Control Sample(s) were analysed with the samples received	✓
A Method Blank was performed with the samples received	✓
Matrix spike(s) was performed as per NEPM frequency	✓

Refer to Certificate of Analysis for all Quality Control data.

Subject: FW: Hold times for 16416

From: Brad.Fitzgerald <Brad.Fitzgerald@environmentalprojects.com.au>
Sent: Wednesday, 22 May 2019 4:39 PM
To: Alex Stenta <astenta@envirolab.com.au>
Subject: RE: Hold times for 16416

Dear Alex,

Hope you are well? I'm plugging along and I'm still coming to terms with the final ever episode of Game of Thrones. I found myself happy, excited, sad, confused – basically just an emotional mess.

Anyways could I please have the following testing arranged for samples on hold at your laboratory, relating to report 16416:

- Sample SB8-2 for MEP of BaP (just within the 60 days) [redacted]
- Sample SB7-2 for ASLP of arsenic & lead -30
- Sample SB1-1 for ASLP of copper and zinc -3

Regards,
Brad Fitzgerald

Subject: RE: Hold times for 16416

HI Brad,

You're holding times for metals are fine.

The recommended holding time for B(a)P is 14 days but as we've spoken about previously, there is evidence that heavier PAH's are stable for up to 60 days if stored cold or frozen.

Let me know if you need any more info.

Method ID	Methodology Summary
Inorg-001	pH - Measured using pH meter and electrode in accordance with APHA latest edition, 4500-H+. Please note that the results for water analyses are indicative only as analysis outside of the APHA storage times.
Inorg-004	Toxicity Characteristic Leaching Procedure (TCLP) using AS 4439 and USEPA 1311. Please note that the sample mass used may be scaled down from the default based on the sample mass available. Samples are stored at 2-6oC before and after leachate preparation.
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS.
Org-012	Leachates are extracted with Dichloromethane and analysed by GC-MS.
Org-012	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater 2013.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

COMPLIANCE TO QC FREQUENCY (NEPM)

Internal laboratory QC rate complies with NEPM requirements (LCS/MB/MS 1 in 20, Duplicates 1 in 10 samples). Note, samples are batched together with other sample consignments in order to assign QC sample frequency.

QC Evaluation	
Duplicate(s) was performed as per NEPM frequency	✓
Laboratory Control Sample(s) were analysed with the samples received	✓
A Method Blank was performed with the samples received	✓
Matrix spike(s) was performed as per NEPM frequency	✓

Refer to Certificate of Analysis for all Quality Control data.

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	:	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260B. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

SAMPLE RECEIPT NOTIFICATION (SRN)

Work Order : **EM1904596**

Client	: **ENVIRONMENTAL PROJECTS**	Laboratory	: Environmental Division Melbourne
Contact	: BRAD FITZGERALD	Contact	: Customer Services EM
Address	: LEVEL 3 117 KING WILLIAM ST ADELAIDE SA 5001	Address	: 4 Westall Rd Springvale VIC Australia 3171

Dates

Date Samples Received	: 29-Mar-2019 13:00	Issue Date	: 29-Mar-2019
Client Requested Due Date	: 05-Apr-2019	Scheduled Reporting Date	: **05-Apr-2019**

Delivery Details

Mode of Delivery	: Undefined	Security Seal	: Not Available
No. of coolers/boxes	: 1	Temperature	: 10.6°C - Ice Bricks present
Receipt Detail	:	No. of samples received / analysed	: 1 / 1

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**
